Amendments to the Claims:

The following list of claims will replace all prior versions of the claims in the application:

- 1. (Currently amended) A computer-implemented method for identifying patterns in data, the method comprising:
- (a) inputting into a classifier at least one support vector machine of a plurality of support vector machines a training set having known outcomes, the classifier at least one support vector machine comprising a decision function having a plurality of weights, each having a weight value, wherein the training set comprises features corresponding to the data and wherein each feature has a corresponding weight;
 - (b) optimizing the plurality of weights so that classifier error is minimized;
 - (c) computing ranking criteria using the optimized plurality of weights;
 - (d) eliminating at least one feature corresponding to the smallest ranking criterion;
- (e) repeating steps (a) through (d) for a plurality of iterations until a subset of features of pre-determined size remains; and
- (f) inputting into the elassifier at least one support vector machine a live set of data wherein the features within the live set are selected according to the subset of features.

2. (Canceled)

- 3. (Currently amended) The method of claim 1, wherein the elassifier at least one support vector machine is a soft margin support vector machine.
- 4. (*Original*) The method of claim 1, wherein the ranking criterion corresponding to a feature is calculated by squaring the optimized weight for the corresponding feature.
- 5. (Original) The method of claim 1, wherein the decision function is a quadratic function.

- 6. (Original) The method of claim 1, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in a single iteration of steps (a) through (d).
- 7. (Original) The method of claim 1, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in at least the first iteration of steps (a) through (d) and in later iterations, eliminating one feature for each iteration.
- 8. (Original) The method of claim 1, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria so that the number of features is reduced by a factor of two for each iteration.
- 9. (Original) The method of claim 1, wherein the training set and the live set each comprise gene expression data obtained from DNA micro-arrays.
- 10. (Original) The method of claim 1, further comprising pre-processing the training set and the live set so that the features are comparably scaled.
- 11. (New) The method of claim 1, wherein step (e) further comprises using a new support vector machine for each iteration.
- 12. (New) The method of claim 1, further comprising the steps of:

 pre-processing the training data set using unsupervised clustering to generate a plurality
 of data clusters;

selecting a cluster center from each of a plurality of data clusters; using the cluster centers to perform steps (b) to (e).

- 13. (New) The method of claim 1, further comprising, after step (e), post-processing the optimum subset of features to generate a plurality of clusters, wherein each feature in the optimum subset of features is a cluster center.
- 14. (New) A computer-implemented method for identifying determinative genes for use in diagnosis, prognosis or treatment of a disease, the method comprising:
- (a) inputting into a support vector machine a training data set of gene expression data having known outcomes with respect to the disease, the support vector machine comprising a decision function having a plurality of weights, each having a weight value, wherein the training set comprises features corresponding to the gene expression data and each feature has a corresponding weight;
 - (b) optimizing the plurality of weights so that classifier error is minimized;
 - (c) computing ranking criteria using the optimized plurality of weights;
 - (d) eliminating at least one feature corresponding to the smallest ranking criterion;
- (e) repeating steps (a) through (d) for a plurality of iterations until an optimum subset of features remains; and
- (f) inputting into the support vector machine a live data set of gene expression data wherein the features within the live data set are selected according to the optimum subset of features.
- 15. (New) The method of claim 14, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in a single iteration of steps (a) through (d).
- 16. (New) The method of claim 14, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in at least the first iteration of steps (a) through (d) and in later iterations, eliminating one feature for each iteration.

- 17. (New) The method of claim 14, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria so that the number of features is reduced by a factor of two for each iteration.
- 18. (New) The method of claim 14, wherein step (e) further comprises using a new support vector machine for each iteration.
- 19. (New) The method of claim 14, further comprising pre-processing the training set to decrease skew in the data distribution.
- 20. (New) A computer-implemented method for identifying patterns in biological data, the method comprising:
- (a) inputting into at least some of a plurality of support vector machines a training data set, wherein the training data set comprises features corresponding to the biological data and each feature has a corresponding weight, and wherein each support vector machine comprises a decision function having a plurality of weights;
 - (b) optimizing the plurality of weights so that classification confidence is optimized;
 - (c) computing ranking criteria using the optimized plurality of weights;
 - (d) eliminating at least one feature corresponding to the smallest ranking criteria;
- (e) repeating steps (a) through (d) for a plurality of iterations until an optimum subset of features remains; and
- (f) inputting into the plurality of support vector machines a live set of biological data wherein the features within the live set are selected according to the optimum subset of features.
- 21. (New) The method of claim 20, wherein step (e) further comprises using a new support vector machine for each iteration.

- 22. (New) The method of claim 20, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in a single iteration of steps (a) through (d).
- 23. (New) The method of claim 20, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria in at least the first iteration of steps (a) through (d) and in later iterations, eliminating one feature for each iteration.
- 24. (New) The method of claim 20, wherein step (d) comprises eliminating a plurality of features corresponding to the smallest ranking criteria so that the number of features is reduced by a factor of two for each iteration.
